

branch in the optimized program materials indicated by the control signal. The MCPS switches to a data mode for transmitting data from the indicated program branch back to the requesting IMD, and then switches back to the voice mode to accept further control signals from the IMD. Once the IMD receives the materials, the IMD decompresses any compressed portions and mixes the decompressed portions with the uncompressed portions to provide enhanced interactive multimedia information to the user. ##

#### REMARKS

The amendments made to the specification and abstract are to correct typographical errors found in the previous amendment relating to page and line numbering. It is submitted that the supplemental amendments are substantively the same as in the previously submitted amendment.

Due to the nature of the amendments made to the specification in the previous amendment, applicant has enclosed a red-line version of the amended specification to aid in the Examiner's review.
